

Abstract

The present invention is directed to the treatment of skin erythema as exhibited in rosacea and other conditions characterized by increased erythema (redness) of the skin. These conditions exhibit dilation of blood vessels due to a cutaneous vascular hyper-reactivity. In particular, the present invention is directed to a novel composition and method for the treatment of skin erythema using α_1 -adrenergic receptor (α_1 -adrenoceptor) agonists incorporated into cosmetic, pharmacological or dermatological compositions for topical application to the skin.
